HLA−II PTM figures: first pass (ASMS)

Caron Lab / Yale · JY cell line, DDA

Here's the first pass of the HLA−II figures for your ASMS talk, the set you asked for (1A−B, 2, 4A−B, 6E). A few notes on how I read the data, since that's the part we went back and forth on last time:

- Length filter 10−25 mer, as you specified.
- Per−PTM counts use every peptide in each sheet's binding block, and I kept sequence variants separate (not deduplicated) the way we agreed in January.
- Strong / Weak / Non split (EL_Rank <0.5 / 0.5−2 / >=2) only where I show binding.
- 14 PTMs, including Nitrosylation (new, it wasn't in the HLA−I set).
- Background (unmodified ligandome, 10−25 mer): 131,324 peptides.

The table below is the sanity check: for every PTM my Strong+Weak equals the All count in your own embedded summary on that sheet, so the counts match yours.

PTM	All (raw)	All 10−25	Strong	Weak	Non	Your SB+WB	check
Deamidation	10688	10669	7156	2543	970	9699	OK
Artifact Oxidation	6482	6351	4284	1360	707	5644	OK
Oxidation	4863	4863	3257	1006	600	4263	OK
Cysteinylation	3349	3349	1191	1270	888	2461	OK
Ubiquitination	3073	3073	1922	804	347	2726	OK
Methylation	2718	2718	1673	627	418	2300	OK
Citrullination	2713	2713	1845	593	275	2438	OK
Ubiquitination	2630	2630	1587	716	327	2303	OK
SUMOylation	2163	2163	1099	623	441	1722	OK
Acetylation	1255	1255	639	342	274	981	OK
N−Glycosylation	1066	1066	550	426	90	976	OK
Phosphorylation	818	818	512	190	116	702	OK
Dimethylation	426	426	233	88	105	321	OK
Carbamidomethylation	277	277	120	67	90	187	OK
Nitrosylation	270	270	136	71	63	207	OK

Figures follow: 1A−B (composition/donut), 2 (length), 4A−B (circos/position), 6E (glycan). First pass, tell me what to change. − Peter
